## Abstracts

A pre-trained language model is a pivotal technological breakthrough that Baidu hails as the cornerstone of reshaping the field of Natural Language Processing (NLP). It learns unsupervisedly from large-scale text data to capture the deep structure and rich semantic information of language. The necessity of such a model lies in its ability to alleviate the scarcity of annotated data, making the training process for specific tasks more efficient and cost-effective. Its distinctive characteristic is the use of high-dimensional dense continuous vectors to represent linguistic knowledge, which not only capture static information about words but also reflect their dynamic changes in different contexts. The superiority of pre-trained language models is evident in their provision of powerful language understanding and generation capabilities across a variety of NLP tasks, significantly enhancing task performance and driving the advancement and widespread application of NLP technology.

The global Pre-trained Language Models (PLMs) market size was estimated at USD 689.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
