Abstracts

Precast Concrete (PC) Components refer to concrete elements that are fabricated in advance in factories or on construction sites and have prestress applied to the concrete during the manufacturing process. Prestress is typically applied by tensioning steel bars, which subjects the concrete to pre-compression before it bears loads. This significantly enhances the components' crack resistance, stiffness and load-bearing capacity. Common PC components include precast beams, columns, slabs and wall panels. They are widely used in various construction projects, contributing to the realization of construction industrialization, improving construction efficiency, ensuring project quality, and reducing on-site wet work and environmental impact.

The global Precast Concrete (PC) Components market size was estimated at USD 15060.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
