Report Overview:

Aluminium Tri Hydrate (ATH) is an inorganic white fine crystalline, non-hygroscopic powder. Its solubility in water and organic solvents is very low. By volume, ATH is the largest flame retardant (FR) used in diverse end applications. The working principle is based on the thermal decomposition of aluminium hydroxide into aluminium oxide and water(vapour). This endothermic reaction starts at about 200 °C and consumes energy from the ignition source. The generated water vapour cools the polymer surface and dilutes the concentration of burnable gases in the surroundings. The remaining metal oxide residue has a high internal surface where sooty particles, respectively polycyclic aromatic hydrocarbons, are absorbed, making ATH also a smoke suppressant. The oxide layer acts as a barrier protecting the polymer against further decomposition.

The Global Precipitated Alumina Trihydrate Market Size was estimated at USD 559.37 million in 2023 and is projected to reach USD 707.78 million by 2029, exhibiting a CAGR of 4.00% during the forecast period.
