Abstracts

Precipitated fine hydrate, also known as precipitated aluminum trihydroxide (ATH), is a specialized flame retardant and smoke suppressant produced through a precipitation process that yields fine, controlled particle sizes with high purity and consistent properties. It functions primarily by releasing water vapor when exposed to heat, which cools the material and dilutes flammable gases, while the resulting alumina residue provides a protective char layer. This inorganic additive is valued for its non-toxicity, halogen-free nature, and compatibility with various polymers, making it a preferred choice in applications requiring enhanced fire safety without compromising environmental or health standards.

The global Precipitated Fine Hydrate market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
