Abstracts

Precleaning Drum Sieve is a mechanical screening device used primarily in agricultural and industrial processing to remove large impurities—such as stones, sticks, chaff, and clumps—from bulk materials like grains, seeds, or granular products before further processing. It consists of a rotating cylindrical drum with perforated surfaces that allow desirable material to pass through while larger debris is separated and discharged. By improving the quality of the input material and protecting downstream equipment from damage or clogging, the precleaning drum sieve enhances operational efficiency, reduces maintenance, and supports overall product quality in processing facilities.

The global Precleaning Drum Sieve market size was estimated at USD 244.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
