Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Preformed Spiral Vibration Damper competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Preformed spiral vibration damper is a vibration-proof device specially used for all-dielectric self-supporting optical cable. It adopts a spiral pre-twisted structure and suppresses micro-motion fatigue caused by wind vibration by changing the fluid dynamic characteristics between the optical cable and the air. Its main principle is to use the deformation and friction of the elastic spiral line to absorb vibration energy, slow down the high-frequency, low-amplitude vibration (i.e., Aiolis vibration) of the optical cable under wind speed changes, thereby preventing the optical cable from breaking or sheath damage due to long-term fatigue at the connection between the tension tower and the hardware. The vibration damper is usually made of thermoplastic polymer material or aluminum alloy, with a length between 800mm and 1500mm. Different models are selected according to the diameter and tension characteristics of the optical cable. It is widely used in overhead laying projects of optical cables in power transmission lines, communication base stations and mountainous areas with strong winds. It is one of the key accessories to improve the operating reliability of ADSS lines and extend their service life.

The global Preformed Spiral Vibration Damper market size was estimated at USD 94.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
