Report Overview

Pregelatinized wheat starch is a modified form of wheat starch that has undergone a process called pregelatinization. During this process, the starch is heated and then cooled, resulting in a starch that has been partially gelatinized. The gelatinization process alters the structure of the starch, making it more soluble and easier to digest. Pregelatinized wheat starch is commonly used as a thickening agent, stabilizer, or texturizer in various food products. It provides a smooth texture and helps improve the moisture retention and shelf life of food items. Pregelatinized wheat starch is gluten-free, making it suitable for individuals with gluten sensitivities.

The global Pregelatinized Wheat Starches market size was estimated at USD 425.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
