Report Overview:

Atomic layer deposition (ALD) is a method of depositing substances layer by layer on a substrate surface in the form of a single atomic film. Atomic layer deposition has similarities with ordinary chemical deposition. But in the process of atomic layer deposition, the chemical reaction of the new layer of atomic film is directly related to the previous layer, which causes only one layer of atoms to be deposited in each reaction. The ALD process can more accurately control the size of thin films, which is becoming increasingly important in DRAM, 3D NAND, and logical FinFET manufacturing and may become the core process for future thin film deposition.

The Global Premium ALD Equipment Market Size was estimated at USD 1920.26 million in 2023 and is projected to reach USD 2996.78 million by 2029, exhibiting a CAGR of 7.70% during the forecast period.
