Abstracts

Prenatal second-generation DNA sequencing refers to the cutting-edge prenatal screening method that uses high-throughput sequencing technology to analyze fetal free DNA in the peripheral blood of pregnant women, in order to detect fetal chromosomal abnormalities and genetic diseases. Compared to invasive examinations such as amniocentesis, this method has significant advantages of non invasiveness and high safety. In terms of clinical application, prenatal second-generation DNA sequencing has expanded from the initial screening for Down syndrome to include screening for sex chromosome abnormalities (such as Turner syndrome, Klinefelter syndrome), microdeletion/microduplication syndrome (such as 22q11.2 deletion syndrome), and some monogenic genetic diseases.

The global Prenatal Second-Generation DNA Sequencing market size was estimated at USD 1290.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
