Abstracts

Presbyopia correcting intraocular lenses (IOLs) are advanced medical devices surgically implanted in the eye to replace the natural lens, primarily addressing presbyopia?an age-related condition characterized by the loss of near-focusing ability. These lenses are designed to restore a full range of vision, reducing or eliminating the need for reading glasses or bifocals post-cataract surgery or refractive lens exchange. Key types include multifocal IOLs, which provide multiple focal points for near, intermediate, and distance vision; accommodating IOLs, which mimic the eye's natural focusing mechanism by shifting position; and extended depth-of-focus (EDOF) IOLs, which create a continuous range of vision with fewer visual disturbances like halos or glare. Technological innovations continue to enhance optical performance, biocompatibility, and customization, with some models incorporating toric components to correct astigmatism. The primary goal is to deliver high-quality, functional vision across varying distances while minimizing dependence on corrective eyewear.

The global Presbyopia Correcting Iols market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
