Report Overview

Health care professionals use the Body Mass Index (BMI), a measure of people weight in relation to height, to define overweight and obesity. People who have a BMI between 25 and 30 are considered to be overweight. Obesity is defined as having a BMI of 30 or greater. Are overweight, obese, or severely obese, which may increase risk of developing health problems. Obesity is a chronic disease and prescription medications to treat overweight and obesity work in different ways. Prescription weight loss medicines can help obese people lose weight. They are usually prescribed by a doctor when diet and exercise alone are not working. Each of these medicines works differently. People who use these medicines may not feel as hungry. Or they may feel full after eating only a small amount of food. Another type of weight-loss medicine makes it harder for your body to absorb fat. Prescription weight loss drugs can be helpful when used in combination with a low-calorie diet and regular physical activity.
