Abstracts

Pressed plastic-bonded permanent magnets are primarily composed of isotropic NdFeB (Neodymium-Iron-Boron) powder and a thermosetting binder. Compared to injection-molded magnets, pressed magnets have a higher powder loading rate, resulting in superior magnetic performance. This allows them to replace sintered ferrite magnets and sintered NdFeB magnets in certain applications. Due to their manufacturing process, pressed magnets are more suitable for regular-shaped components with lower mechanical strength requirements. To enhance corrosion resistance and maintain optimal performance, an epoxy coating is typically applied via electrophoresis or spraying, especially in humid environments. Notably, pressed magnets are isotropic, meaning they can be magnetized in any direction to meet various application needs.

The global Pressed Plastic-bonded Permanent Magnets market size was estimated at USD 316.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
