Abstracts

A pressure defoaming oven is a specialized industrial heating system designed to remove air bubbles, volatiles, and other entrapped gases from materials?such as adhesives, resins, potting compounds, or electronic encapsulants?by applying controlled heat within a sealed, pressurized chamber. This process accelerates degassing while preventing material expansion or boiling, ensuring uniform consistency, improved product integrity, and enhanced performance in applications like electronics manufacturing, composite production, and automotive component assembly. These ovens typically feature precise temperature and pressure controls, safety interlocks, and robust construction to handle varying operational demands across sectors requiring high-reliability material processing.

The global Pressure Defoaming Oven market size was estimated at USD 75.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
