Report Overview:

Pressure Swing Adsorption (PSA) is the most commonly used non-cryogenic oxygen production process; most effective for small and medium capacities. The process operates by using two columns filled with adsorbent, a molecular sieve called Zeolite. Pre-treated compressed air enters the first column and flows up through the Zeolite. Nitrogen and some other gases are being trapped while the oxygen is allowed to flow through. When the active column is saturated, the air flow is directed to second column. The first column depressurizes allowing nitrogen to be purged out to the atmosphere and completely regenerates. The process is repeated continuously, when one column is productive, the other regenerates and at the end of each cycle they switch roles. The generator produces constant flow of purified oxygen.

The oxygen production industry is a huge industry. Generally speaking, the market can be divided into two market segments: industrial oxygen and medical oxygen. In the industrial oxygen market, the most common equipment used by industrial manufacturers is an air separation unit. Although the air separation unit also uses PSA technology, it is not classified as a PSA oxygen generator. Therefore, it is necessary to explain the statistical scope of the report. The report covers industrial oxygen generators and medical oxygen generators used in various industries. In general, the price of industrial oxygen generators is relatively high, ranging from thousands of dollars to tens of thousands of dollars. Most industrial oxygen generators are on-site oxygen generators. The price of medical oxygen generators is relatively cheap, ranging from small tens of dollars to thousands of dollars. Of course, large on-site oxygen generators can also be used in the medical field.

The Global Pressure Swing Adsorption Oxygen Generator Market Size was estimated at USD 3007.28 million in 2023 and is projected to reach USD 3569.98 million by 2029, exhibiting a CAGR of 2.90% during the forecast period.
