## Abstracts

Pressurized Sewer Main System is a pressurized pipeline network used to convey wastewater or sewage from lower to higher elevations, typically where gravity flow is not possible. It operates in conjunction with pump stations that generate the necessary pressure to move the sewage through the force main toward treatment plants or gravity sewer lines. The system is constructed from durable materials capable of withstanding internal pressure and corrosion, ensuring reliable transport of wastewater over long distances. Pressurized Sewer Main Systems are essential components of modern wastewater infrastructure, maintaining continuous and controlled flow to prevent backups and environmental contamination.

The global Pressurized Sewer Main System market size was estimated at USD 4963.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
