Abstracts

Presulfurizing catalysts are specialized chemical agents used in the petroleum refining and petrochemical industries to convert metal oxides in hydroprocessing catalysts into active metal sulfides before their operational use, thereby enhancing catalyst performance, stability, and resistance to deactivation during processes such as hydrodesulfurization, hydrodenitrogenation, and hydrocracking. These catalysts typically contain sulfur compounds like dimethyl disulfide or polysulfides that decompose under controlled conditions to release H₂S, which reacts with the metal components (e.g., cobalt, molybdenum, nickel, tungsten) of the hydroprocessing catalyst, ensuring optimal catalytic activity and longevity while minimizing the risk of overheating or damaging the catalyst bed during the startup phase of refinery units.

The global Presulfurizing Catalyst market size was estimated at USD 320.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
