The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Prevailing Torque Locknuts competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A prevailing torque locknut is a self-locking nut that provides resistance to rotation through structural features, such as localized plastic deformation of metal threads (e.g., elliptical deformation, top crimping) or non-metallic inserts (like nylon rings), creating an interference fit with the mating bolt threads. This design ensures that the nut maintains a consistent frictional resistance during installation and under operational conditions, preventing loosening due to vibration, shock, or thermal cycling. Prevailing torque locknuts are widely used in industries such as aerospace, automotive, railways, and heavy machinery, where high resistance to vibration-induced loosening is critical. It's important to note that the locking effectiveness of prevailing torque locknuts may diminish with repeated use, so their reuse should be limited in critical applications.

The global Prevailing Torque Locknuts market size was estimated at USD 82.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
