Abstracts

Primary cell hydrogen sensors are electrochemical devices that utilize a galvanic cell configuration to detect and quantify hydrogen gas concentrations by generating an electrical current proportional to the partial pressure of hydrogen, with the sensor typically consisting of a sensing electrode, counter electrode, and electrolyte where hydrogen oxidation occurs at the anode, producing a measurable signal without requiring an external power source due to the self-powered nature of the electrochemical reaction. These sensors are valued for their high specificity to hydrogen, low cross-sensitivity to other gases, fast response times, and ability to operate effectively across a wide range of environmental conditions, making them particularly suitable for safety-critical applications such as leak detection in industrial settings, fuel cell systems, and hydrogen refueling stations, where reliability and minimal maintenance are paramount.

The global Primary Cell Hydrogen Sensor market size was estimated at USD 35.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
