## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Primary Current Injection Tester competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Primary Current Injection Tester is a specialized electrical testing device used to simulate high current faults and validate the performance of primary protection systems in power distribution networks. Unlike secondary injection testers that assess protective relays by bypassing the entire system, primary current injection testers deliver high primary currents—often in the range of hundreds to tens of thousands of amperes—directly through circuit breakers, current transformers (CTs), and protective relays, thereby testing the full protective path under near-real operating conditions. These testers typically consist of a current source, control unit, and monitoring capabilities, and can be configured as portable or modular systems. They are commonly used for testing circuit breakers (to verify trip characteristics), protection relays (especially overcurrent, differential, and ground fault types), CT saturation points, and the continuity of busbars and cabling. Applications span utilities, substations, switchgear maintenance, and commissioning of power systems. Advanced models often include automatic control, digital timing, programmable sequences, and built-in safety interlocks.

The global Primary Current Injection Tester market size was estimated at USD 108.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
