Abstracts

Primary hyperoxaluria refers to a group of rare, inherited metabolic disorders characterized by excessive production of oxalate, which leads to kidney stones, nephrocalcinosis, and often end-stage renal disease due to progressive oxalate accumulation. The market for primary hyperoxaluria drugs focuses on therapeutic interventions that address the underlying enzymatic deficiencies?most commonly involving alanine-glyoxylate aminotransferase (AGT) in type 1 (PH1), glyoxylate reductase/hydroxypyruvate reductase (GRHPR) in type 2 (PH2), and mitochondrial 4-hydroxy-2-oxoglutarate aldolase (HOGA1) in type 3 (PH3)?to reduce oxalate overproduction or enhance its clearance. Current treatments include small molecule inhibitors like lumasiran and nedosiran, which utilize RNA interference (RNAi) technology to silence key enzymes in oxalate synthesis, as well as vitamin B6 (pyridoxine) for a subset of PH1 patients, with liver-kidney transplantation reserved for severe cases. The market is driven by high unmet medical needs, growing diagnostic capabilities, orphan drug designations, and premium pricing for novel therapies, though it remains constrained by the rarity of the disease, diagnostic delays, and reimbursement challenges in certain regions.

The global Primary Hyperoxaluria Drug market size was estimated at USD 208.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.25% during the forecast period.
