Abstracts

Primary tumor cell culture refers to the in vitro establishment and maintenance of cells directly derived from patient tumor tissues, preserving key biological characteristics such as heterogeneity, genetic profiles, and functional behaviors observed in the original malignancy. This methodology involves meticulous isolation techniques to extract viable tumor cells from surgical specimens or biopsies, followed by cultivation under optimized conditions that mimic the tumor microenvironment, often requiring specialized media, growth factors, and extracellular matrix support to sustain proliferation and prevent phenotypic drift. Unlike immortalized cell lines, primary cultures offer a more clinically relevant model for studying cancer biology, drug response, resistance mechanisms, and personalized therapeutic strategies, though they present challenges including limited lifespan, contamination risks, and inter-patient variability that necessitate rigorous standardization and validation in research and diagnostic applications.

The global Primary Tumor Cell Culture market size was estimated at USD 575.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
