Report Overview:

Genome editing or most profoundly called gene editing is a set of advanced tools and technologies that are involved in the alteration of a particular DNA sequence. Genome editing lets the scientists indulge in adding, removing, or altering a particular gene/genetic material at a precise location on the genome. The market has witnessed various types of approaches that fall under the umbrella of genome editing across the globe. These are Cas9 (CRISPR-associated protein 9), ZFNs (zinc-finger nucleases), CRISPR (clustered regularly interspaced short palindromic repeats), TALENs (transcription activator-like effector nucleases), and Antisense. A new addition to the list of technologies is the prime editing technology which was recently proposed i.e. in the early months of 2019. Famously called “search and replace” technology, prime editing is a genetic or DNA strand editing technology that can do gene base manipulation using the prime gene part of the DNA. Insertion, deletion, and base swapping are the major roles of this technology.

The Global Prime Editing Technology Market Size was estimated at USD 1461.09 million in 2023 and is projected to reach USD 2192.70 million by 2029, exhibiting a CAGR of 7.00% during the forecast period.
