Abstracts

Printed electronic component is a set of printing methods, which is used to create electrical devices on different substrates such as plastic, ceramic, and textiles. Printed electronics refers to the combination of conductive materials as well as varnish and ink systems, transferred in multiple layers to large areas of film, paper or other substrates at low cost. They perform functions of conventional electronics with special processing possibilities. Printed electronics technology is an emerging technology that combines printing technology with electronic manufacturing. Different from traditional electronic manufacturing technology, printed electronics technology has the advantages of large area, flexibility, large-scale preparation, low cost, and green environmental protection. Printed electronics (PE) has received increasing attention in the field of electronic device manufacturing and has broad future market prospects due to its ability to avoid the high cost and inflexibility of traditional silicon-based electronic devices and use traditional printing technology to manufacture various devices on flexible substrates. The production process of using printed electronics technology to prepare electronic devices is simple and does not require the use of a large number of chemical reagents. The emissions of waste water and toxic gases are greatly reduced, and the goals of green, environmentally friendly and energy-saving production are well achieved.

The global Printed Electronic Components market size was estimated at USD 2966.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.60% during the forecast period.
