Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Printer Corona Treater competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A corona treater is a device used to increase the surface energy of materials. It is widely used in the pre-treatment of printing, coating and lamination of substrates such as plastic films, metal foils, and paper. Its core principle is to generate corona discharge between the electrode and the grounded roller through a high-voltage electric field to ionize the air, thereby inducing microscopic oxidation reactions and molecular structural changes on the surface of the material. This treatment can significantly improve surface wettability and adhesion, allowing inks, coatings or adhesives to adhere more firmly to the material. Corona treatment is usually performed after material extrusion or before printing, and is particularly suitable for polymers with low surface energy such as polyethylene (PE) and polypropylene (PP). The surface energy of the treated material (expressed in dyne value) can be increased from 30 dyn/cm to more than 38 dyn/cm, thus meeting the needs of high-quality printing and bonding.

The global Printer Corona Treater market size was estimated at USD 548.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
