Abstracts

A probe thermocouple is a sensor used for temperature measurement. It generates thermoelectric potential through the contact point (thermocouple junction) of two different metal materials, which is then converted into a temperature signal. The sensor usually has a probe shape, which is convenient for direct contact with the object being measured. Probe thermocouples have the advantages of fast response speed, high temperature resistance, and high measurement accuracy. They are widely used in industrial process control, material testing, scientific research experiments and other fields, especially for temperature measurement in high temperature environments. Common types include K-type, J-type and other thermocouples.

The global Probe Thermocouple market size was estimated at USD 3339.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
