## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Probiotic Medication competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Probiotic Medication production reached approximately 25.2 million units, with an average global market price of around US\$ 30 per unit. In 2024, the global's total production capacity of Probiotic Medication reached 31.5 million units. The industry average gross profit margin of this product reached 33%. Probiotic medications are formulations containing live microorganisms, such as specific strains of Lactobacillus and Bifidobacterium, which are administered in adequate amounts to confer a documented health benefit. Unlike general probiotic foods or supplements, these products are often developed and regulated for specific therapeutic applications. These uses include managing conditions like antibiotic-associated diarrhea, infectious diarrhea, and other gastrointestinal disorders, supported by clinical evidence for targeted health restoration. The upstream sector involves the supply of raw probiotic strains, specialized culture media, and research into specific bacterial strains. Midstream activities include the fermentation, processing, and formulation of these strains into final medicinal products like capsules, sachets, or tablets. The downstream flow then distributes these products to hospitals, pharmacies, and ultimately to patients, often requiring cold chain logistics to maintain viability.

The global Probiotic Medication market size was estimated at USD 758.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
