Abstracts

In the improvement of osteoporosis and fractures, probiotics can promote bone formation and regeneration by regulating the balance of pro-inflammatory T helper cells such as Treg and Th17 cells, increasing the secretion of anti-inflammatory factors such as TGF- β and IL-10, and inhibiting the formation of osteoclasts. Probiotics that can promote bone density enhancement and bone regeneration include *Lactobacillus rhamnosus*, *Lactobacillus acidophilus*, and *Lactobacillus plantarum*. In the improvement of osteoarthritis, probiotics can inhibit inflammation-related signaling pathways by producing short-chain fatty acids such as butyrate, thereby protecting articular cartilage from degradation and destruction. Probiotics that can protect bone joints from inflammatory invasion include *Lactobacillus casei* and *Lactobacillus acidophilus*. In the improvement of dental caries and periodontitis, probiotics can competitively inhibit the growth of oral pathogens, reduce the colonization of pathogens such as *Streptococcus mutans* and *Porphyromonas gingivalis*, and produce antibacterial substances to inhibit the proliferation of pathogens. Probiotics that can maintain tooth and periodontal homeostasis include *Lactobacillus paracasei*, *Lactobacillus plantarum* and *Streptococcus salivarius*.
