### Report Overview:

Burner is a device that controls the mixing of air with a combustible fuel to produce a stable flame pattern. In the report, we focused on burners used in oil and chemical industry.

A flare system collects and discharges gas from atmospheric or pressurized process components to the atmosphere to safe locations for final release during normal operations and abnormal conditions. A flare system consists of a flare stack and pipes that feed gas to the stack. The type and amount of gas or liquids in the flare stack governs the sizing & brightness of the flare.

Thermal oxidizers reduce air pollution emissions from a variety of industrial processes. Using the principle of “thermal oxidation,” a combustion process, the contaminants within the polluted exhaust gas react with oxygen in a temperature controlled environment. The chemical oxidation reaction destroys the contaminants in the polluted exhaust gas before discharging it back into the atmosphere. What is released is an innocuous emission of CO<sub>2</sub>, water vapor, and heat.

The Global Process Burners, Process Flares and Thermal Oxidizer Systems Market Size was estimated at USD 1220.65 million in 2023 and is projected to reach USD 1440.62 million by 2029, exhibiting a CAGR of 2.80% during the forecast period.
