Abstracts

Process manufacturing is a production method in which finished products are created by mixing together raw materials and ingredients. This involves boiling, blending, combining, or otherwise joining the ingredients together in a ?process? which outputs a volume of end-product, instead of individual units. For the most part, therefore, process manufacturing occurs in bulk quantities using a batch production workflow. Instead of BOMs, process manufacturers use recipes and formulas to determine the constituents of their products. It is, therefore, crucial that the production planning system that a company employs has the technical capacity to accommodate recipe control, as well as units of measurement (UOM) conversions and scalability. If the formula or a recipe of a product is scalable, different size batches of a product can be created using the same formula.

The global Process Industry Wireless Automation market size was estimated at USD 1781.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.60% during the forecast period.
