Abstracts

Processability improvers are chemical additives specifically designed to enhance the manufacturing characteristics of polymers and other materials during processing, primarily by reducing viscosity, improving flow properties, minimizing energy consumption, and facilitating easier extrusion, molding, or shaping without significantly altering the final product's mechanical or thermal properties. These additives function through mechanisms such as internal lubrication, chain scission, or compatibilization, and are commonly used in industries like plastics, rubber, and composites to address challenges related to high melt viscosity, poor dispersion of fillers, or processing instability. They enable manufacturers to achieve higher production rates, reduce defects such as melt fracture or die swell, improve surface finish, and allow for the use of higher filler loadings or recycled materials, thereby optimizing efficiency, sustainability, and cost-effectiveness in industrial operations.

The global Processability Improver market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
