Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Prodiamine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Prodiamine was approximately 5,500 tons, with an average selling price of about US\$12,400 per ton. Single-line production capacity was approximately 500 tons per year, with an average gross profit margin of 15-25%. Prodiamine is a selective pre-emergence soil-applied herbicide, primarily used in landscaping, lawns, and nurseries. It inhibits weed growth by suppressing cell division, particularly effective against germinating grasses and some broadleaf weeds. Its mechanism of action is to interfere with spindle formation, thereby inhibiting root and shoot growth. The upstream raw materials for Prodiamine mainly come from petrochemical and basic chemical products, including aniline, o-nitrochlorobenzene, propanol, and fuming sulfuric acid/chlorosulfonic acid, which are the core starting materials for synthesizing its technical grade. Downstream applications are directly in agriculture, where it is widely used as a selective pre-emergence herbicide in cotton, soybeans, orchards, vineyards, ornamental plant nurseries, and non-crop areas to control annual grasses and some broadleaf weeds.

The global Prodiamine market size was estimated at USD 68.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Prodiamine market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights. It examines market size, competitive landscape, emerging
