Abstracts

A produced water cooler is a device specifically designed to cool process water in industrial processes, ensuring that critical equipment and processes operate at optimal temperature conditions. It is widely used in industries such as chemicals, pharmaceuticals, food processing, plastic manufacturing, and metal processing to help improve production efficiency and extend equipment life. This type of chiller usually consists of a chiller, heat exchanger, water pump, and control system. The chiller is the core component, absorbing heat from the process water through the refrigerant circulation to reduce the water temperature. The heat exchanger achieves efficient heat transfer between the cooling water and the high-temperature process water, while the water pump is responsible for pushing the water through the entire system.

The global Produced Water Coolers market size was estimated at USD 2658.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
