Abstracts

Profiled steel decking is a structural building product typically manufactured from galvanized or coated steel sheets that are cold-rolled into a ribbed profile, designed to act as permanent formwork for concrete floors and roofs in commercial, industrial, and institutional construction. These decks serve multiple integrated functions, including providing a working platform during construction, reinforcing and bonding with concrete to form composite slabs that enhance structural strength and load distribution, and often incorporating embossments or deformations to improve shear transfer between steel and concrete. Additionally, profiled steel decking systems may accommodate utilities such as electrical conduits or HVAC components within their voids and can contribute to the building's fire resistance and thermal performance when specified with additional treatments or insulation.

The global Profiled Steel Decking market size was estimated at USD 1350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
