Abstracts

A programmable single-channel DC power supply is a DC power supply device that can accurately control the output voltage and current through computer programming or digital interface. A programmable single-channel DC power supply has only one output channel, which means it can independently control the output parameters of that channel, such as voltage and current. Users can send instructions through computer programming or digital interfaces (such as GPIB, RS-232, LAN, etc.) to set the power supply's output voltage, current range, output mode and other parameters. The power supply can automatically adjust the output characteristics according to the program or instructions set by the user to meet the needs of different loads and applications.

The global Programmable Single-channel DC Power Supply market size was estimated at USD 245.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
