## Abstracts

Projector light valve chips are the core components of projectors, responsible for modulating the light beam from the light source into images. These chips manipulate light by controlling its transmission, reflection, or refraction to create high-resolution images and are widely used in DLP (Digital Light Processing), LCD (Liquid Crystal Display), and LCoS (Liquid Crystal on Silicon) projection technologies. Different types of light valve chips have their unique advantages?for instance, DLP chips are known for their fast response times and high contrast, while LCD and LCoS chips excel in color performance and image refinement. The performance of the light valve chip directly determines the projector's brightness, resolution, contrast, and color accuracy, making it a critical factor in improving projection quality.

The global Projector Light Valve Chip market size was estimated at USD 262.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
