## Abstracts

Pomeprazole Injection is a proton pump inhibitor (PPI) formulation administered intravenously for the treatment of conditions involving excessive gastric acid secretion, such as gastroesophageal reflux disease (GERD), peptic ulcers, and Zollinger-Ellison syndrome, particularly in patients who are unable to take oral medications. It functions by irreversibly inhibiting the H<sup>+</sup>/K<sup>+</sup> ATPase enzyme system at the secretory surface of gastric parietal cells, thereby reducing both basal and stimulated acid production. As an injectable form of a widely utilized therapeutic class, it is primarily employed in hospital and clinical settings for acute management, postoperative care, or in critically ill patients where rapid and reliable acid suppression is required. Its efficacy, safety profile, and compatibility with IV administration make it a key option within the broader PPI market, addressing specific clinical needs that oral formulations cannot fulfill.

The global Pomeprazole Injection market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
