## Abstracts

A proportional flow valve is a valve whose flow is proportional to the control signal. It is composed of a proportional solenoid and a flow valve. It can change the opening of the valve core (effective flow cross-sectional area) by controlling the current in the proportional solenoid coil, thereby achieving continuous proportional control of the output flow. Proportional flow valves are widely used in systems that require continuous remote control or program control of hydraulic parameters.

The global Proportional Flow Valve market size was estimated at USD 796.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
