Abstracts

Proportional polyphosphates dosing unit is an automated dosing device designed for water treatment systems to solve the common scaling problem in domestic and industrial water systems. During the heating process, calcium and magnesium ions in water will react chemically to form precipitates such as calcium carbonate, which will adhere to the heat exchange surface of the hot water production system, resulting in reduced system efficiency and even failure. To prevent this problem and comply with relevant national standards and boiler manufacturers' recommendations, it is necessary to install a proportional polyphosphates dosing unit. The proportional polyphosphates dosing unit ensures that the concentration of polyphosphates is always kept within the regulatory range through continuous and stable dosing, while maintaining the activity of its scale and corrosion inhibition properties. This control method not only improves the accuracy and efficiency of dosing, but also helps to extend the service life of water treatment equipment and reduce maintenance costs. The device is suitable for various types of gas/electric boilers and water heaters, providing a highly efficient and reliable water treatment solution for domestic and industrial users.

The global Proportional Polyphosphates Dosing Unit market size was estimated at USD 1257.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
