Abstracts

Propylene glycol alginate (PGA) is a modified form of alginic acid, a natural polysaccharide derived primarily from brown seaweed, where it is esterified with propylene oxide to improve its solubility and stability in acidic environments. This chemical modification enhances its functional properties, such as thickening, stabilizing, emulsifying, and forming films, making it particularly valuable in applications where standard alginates might be less effective, such as in low-pH systems like salad dressings, fruit juices, and beer. PGA is widely recognized for its ability to create stable foams and prevent syneresis (liquid separation) in various products, and it is approved as a safe food additive (E405) by regulatory bodies including the FDA and EFSA, with additional uses extending to pharmaceuticals, cosmetics, and certain industrial applications where its unique rheological characteristics are advantageous.

The global Propylene Glgcol Alginate market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
