Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Propylene Glycol Block Polyether competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Propylene glycol block polyether is a nonionic polyether surfactant formed by the block polymerization of ethylene oxide and propylene oxide. It has multiple functions such as solubilization, detergency, emulsification, wetting, and defoaming, and is a biodegradable chemical. Propylene glycol block polyether products are produced by ring-opening polymerization with propylene oxide, followed by ethylene oxide, using propylene glycol as an initiator. Propylene oxide is the core raw material and accounts for the largest portion of production costs. Due to the polarity of the polyether and its low viscosity, propylene glycol block polyethers can form very stable lubricant films with high adsorption and load-bearing capacity under most lubricating conditions. These films exhibit a low coefficient of friction and strong shear resistance, making them widely used in industry, agriculture, medicine, and other sectors. Global sales in 2024 are expected to be approximately 58,000 tons, with an average market price of approximately \$2,600 per ton. Single-line production capacity varies depending on the production process and investment in production equipment, typically ranging from 1,000 to 5,000 tons per year, with industry gross profit margins ranging from 12% to 30%.

The global Propylene Glycol Block Polyether market size was estimated at USD 151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
