Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Prostate Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Prostate Model production reached approximately 3.55 M units, with an average global market price of around US\$ 120 per unit. A prostate model is a three-dimensional physical or interactive anatomical model used for medical education, patient education, surgical simulation, and research training. It is used to demonstrate the anatomical structure, function, and pathological changes of the male prostate. Its design typically considers the size, shape, tissue structure, and relationship with adjacent organs (such as the bladder, urethra, and rectum) to help medical students, doctors, and patients intuitively understand prostate anatomy and related diseases.

Gross Profit Margin Analysis

Prostate models, as a subcategory of medical anatomical models, generally have high gross profit margins, typically ranging from 40% to 65%. This is primarily due to the fact that these products are customized or produced in small quantities, representing high-value-added educational/medical instruments. Raw material costs (such as resin, plastic, or silicone) are relatively controllable, while R&D, design, and mold manufacturing are the main cost inputs. Manufacturers typically enhance added value through differentiated designs, detachable functions, and pathological display models, thereby maintaining high profit levels. Meanwhile, the industry primarily operates on a small-batch, high-price sales model, with additional teaching materials, interactive components, and customized services further enhancing the product's gross profit margin. For export-oriented manufacturers, international market prices are higher than domestic market prices, which also contributes to maintaining a stable overall gross profit margin.

Industry Drivers

The core factors driving the growth of the prostate model industry mainly include the increasing demand for medical education, the

popularization of patient education, and the rise of surgical training simulations. First, the global demand for high-quality anatomical models from medical schools and professional training institutions continues to rise, especially the emphasis on teaching related to the male urinary system and prostate diseases, directly driving market demand. Secondly, with increased awareness of men's health, hospitals and clinics are increasingly using prostate models for patient education and health promotion, thereby increasing product usage scenarios and sales. Furthermore, the development of minimally invasive surgery and prostate disease treatment technologies requires operable and simulating anatomical models for surgical training and instrument testing, which further drives technological innovation and product upgrades in the industry. In summary, education, medical training, and increased awareness of health management are the key forces driving the steady growth of the prostate model market.

The global Prostate Model market size was estimated at USD 426.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
