Report Overview

The prostatic puncture robot is a sophisticated robotic surgical system that is used to perform prostatic biopsy procedures. The system consists of a robotic arm equipped with a needle holder, a video camera, and other surgical instruments that are controlled by a surgeon through a computer console. The robot is designed to precisely target and sample tissue from the prostate gland in a minimally invasive manner, thereby reducing the risk of complications and improving patient outcomes. During a prostatic biopsy procedure using a prostatic puncture robot, the surgeon controls the robot arm remotely to guide the needle into the prostate gland. The robotic arm is designed to move with extreme precision, allowing the surgeon to target and access specific areas of the prostate gland. The video camera attached to the robot also provides the surgeon with real-time images of the prostate gland, helping to improve the accuracy and safety of the procedure. Prostatic puncture robot-assisted biopsies are performed with the patient under local anesthesia, and the procedure typically takes 30-60 minutes to complete. The system is designed to be minimally invasive, with small incisions made in the skin to allow the needle and instruments to enter the body. The use of a prostatic puncture robot offers several advantages over traditional biopsy procedures, including decreased pain, less bleeding, and a lower risk of complications.
