### Report Overview

A portable dynamometer, also known as a portable dyno or portable dynamometer, is a device used to measure and assess the power, torque, and performance of engines, motors, and other rotating equipment. It is designed to be easily transportable, allowing for on-site testing and evaluation. Portable dynamometers typically consist of a load cell or strain gauge that measures the force exerted by the engine or motor under test. This force measurement is then used to calculate the torque (rotational force) being produced by the equipment. Some portable dynamometers also have sensors to measure other parameters such as speed, temperature, and vibration.
