Abstracts

Proteasome inhibitors are a class of drugs that specifically target and inhibit the proteasome, a large protein complex responsible for degrading damaged or unneeded proteins within cells, thereby disrupting intracellular protein homeostasis. By blocking this critical degradation pathway, these compounds lead to the accumulation of polyubiquitinated proteins, induction of endoplasmic reticulum stress, and ultimately apoptosis, particularly in rapidly dividing cells such as cancer cells. This mechanism of action has proven highly effective in the treatment of hematologic malignancies, most notably multiple myeloma and mantle cell lymphoma, where proteasome inhibitors like bortezomib, carfilzomib, and ixazomib have become cornerstone therapeutic agents. Their clinical success has expanded research into their application for other oncological and non-oncological conditions, though their use remains predominantly within oncology due to their targeted impact on malignant plasma cells and other proliferative tumor types.

The global Proteasome Inhibitors market size was estimated at USD 4512.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
