Report Overview:

Protein A chromatography resin is a specialized medium used in protein purification processes based on the affinity chromatography technique. It is designed to selectively bind and purify antibodies and antibody-based molecules, such as monoclonal antibodies (mAbs), from complex mixtures like cell culture supernatants or biopharmaceutical production streams. Protein A is a bacterial protein derived from *Staphylococcus aureus*, and it exhibits a strong affinity for the Fc region of immunoglobulin G (IgG) antibodies.

The resin consists of porous beads to which Protein A molecules are immobilized. When a mixture containing antibodies is passed through the column containing the Protein A chromatography resin, the antibodies specifically bind to the Protein A ligands while other unwanted impurities flow through the column. The bound antibodies are then eluted from the resin using a buffer or elution solution, resulting in highly purified antibodies suitable for therapeutic or research applications.

The Global Protein A Chromatography Resin Market Size was estimated at USD 109.23 million in 2023 and is projected to reach USD 155.83 million by 2029, exhibiting a CAGR of 6.10% during the forecast period.
