## Abstracts

A form of the anticancer drug paclitaxel that is used alone or with other drugs to treat certain types of breast cancer, non-small cell lung cancer, and pancreatic cancer. Protein-bound paclitaxel may have fewer side effects and work better than other forms of paclitaxel. It is also being studied in the treatment of other types of cancer. Protein-bound paclitaxel stops cancer cells from growing and dividing and may kill them. The primary driver of the Protein Bound Paclitaxel (Abraxane) market is its effectiveness in treating various cancers, particularly breast, lung, and pancreatic cancers. Its unique formulation, which binds paclitaxel to albumin, allows for better solubility and enhanced delivery of the drug to tumors. This formulation reduces the need for toxic solvents, improving patient tolerance and enabling higher doses to be administered. Additionally, the rising incidence of cancer globally, advancements in healthcare infrastructure, and growing awareness of novel cancer therapies contribute to market growth. However, the market faces several challenges. One significant hurdle is the high cost of Protein Bound Paclitaxel, which can limit its accessibility, especially in low- and middle-income countries. Furthermore, the availability of alternative treatments and generic versions of paclitaxel adds competitive pressure. Side effects associated with the drug, such as neuropathy and myelosuppression, also pose challenges to its wider adoption, as they may discourage long-term use or limit patient eligibility for the therapy. Bristol Myers Squibb is global leading company, in 2023 the revenue is 821.2 million USD, with the global market share is about 59%.

The global Protein Bound Paclitaxel market size was estimated at USD 1478.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
