Report Overview

Protein Chip is a technique of tracking the activities of proteins. This technique is used for monitoring the expression of the protein and determining the function of large number of protein in a single experiment. Protein chip consists of a surface such as nitrocellulose membrane, microtitre plate, glass slide, and bead. This surface helps in tracking all the activities of proteins. These Protein chips are economical, automated, rapid, highly sensitive and capable of tracking minute quantities of reagents/ sample. The application of protein chip includes antibody characterization, analysis of protein functions, proteomics, and diagnostics. Protein chips also overcome the major restraint of the conventional DNA microarray. DNA microarray was unable to monitoring the level of gene expression in proteomics.
