Abstracts

The Protein Drug Screening and Validation Database is a database specifically used to store and manage information related to protein targets and candidate drugs, supporting screening and validation in the drug discovery process. The database integrates protein structure, function, and interaction data, as well as the activity, toxicity, and metabolism of small molecule compounds, to help researchers effectively screen and evaluate potential drug targets and candidate molecules. Through comprehensive data integration and efficient retrieval and analysis capabilities, the Protein Drug Screening and Validation Database has greatly accelerated the drug development process and improved the efficiency and accuracy of new drug discovery. The protein drug screening validation database plays a key role in modern drug development because it integrates structural and interaction information from a large number of proteins and small molecule compounds, significantly improving the efficiency of drug discovery. In the context of the surge in bioinformatics data and the upgrade of computing resources, more and more databases are deployed to the cloud to support a more flexible and rapid drug screening and verification process. At the same time, with the advancement of artificial intelligence and big data analysis, the application of databases is no longer limited to data storage, but has become an important tool to promote intelligent drug screening, target discovery and precise drug design. This new data-driven approach is not only expected to shorten the research and development cycle, but will also promote the innovative development of personalized medicines and new therapies.

The global Protein Drug Screening Validation Database market size was estimated at USD 1855.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
