Report Overview

Protein-free and serum-free media are specialized cell culture media formulations that do not contain any animal-derived proteins or serum components. These media are used in cell culture to support the growth and maintenance of cells in vitro, without the need for traditional serum-containing media, which often contain bovine serum. Traditional cell culture media often use fetal bovine serum (FBS) or other animal-derived sera as a supplement. While serum provides essential nutrients, growth factors, and hormones necessary for cell growth, it also introduces variability and potential risks, such as batch-to-batch variations, contamination, and the presence of undefined components.
