Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Protein G Sepharose competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Protein G Sepharose is an affinity chromatography medium used primarily for the purification and isolation of immunoglobulins, especially IgG, from complex biological mixtures such as serum, cell culture supernatants, or ascitic fluid. It consists of Protein G, a bacterial cell wall protein derived from *Streptococcus*, which has a high affinity for the Fc region of most mammalian IgG antibodies, covalently bound to Sepharose beads—a cross-linked, inert agarose gel. The beads act as a solid support matrix, allowing Protein G to selectively bind antibodies while other components are washed away. Protein G Sepharose is widely used in biochemical, immunological, and biopharmaceutical applications for antibody purification, immunoprecipitation, and co-immunoprecipitation workflows. Compared to Protein A, Protein G offers broader species and subclass binding specificity, particularly effective for mouse IgG1 and rat IgG subclasses, making it a valuable tool in both research and clinical antibody production.

The global Protein G Sepharose market size was estimated at USD 226.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
